

## **Pharm Robotics Secures Revolutionary Patent for a Robotic Injection System.**

Automating the labor-intensive shot delivery process for dairy and beef cows.

**San Jacinto, CA (January 20th, 2021) - Pharm Robotics** is quickly joining the ranks of hot crowdfunding campaigns as they have raised over \$240,000 since the company's founding.

"Pharm Robotics is the first to market robotic shot delivery system. We are very excited that we recently received our patent in the mail granting us the exclusive right to create a robotic injection system to deliver vaccines, reproductive hormones, and liquid materials to domestic herd animals. As a dairy farmer myself, I that understand firsthand the hardships that come from the shortage of workers, labor costs, and competitive food market that challenge our industry. I have managed dairies with 3,000 cows where we gave about 54,000 shots annually by hand and now, I am really looking forward to automating this process to solve this major problem!" said Marinus Dijkstra, Founder and CEO. "We're utilizing crowdfunding for a strategic way to raise capital with others that understand these common industry problems and looking forward to more profitable farming with healthier herds. I couldn't be more excited for the future of dairy!"

Mr. Dijkstra immigrated to the US at the age of 18 and has worked in dairy ever since. He now has over 20 years of dairy management experience. One afternoon in 2017 after dealing with many problems on the dairy, he came up with the idea of automating this process and approached Alexander Chuck (current CFO and Co-Founder) who at the time managed his compost operation. Together, they worked to expand this idea and filed a patent. Over time, they have brought on MBA graduate, Connor Broughton as CMO and four other strategic partners to help carry out their vision.

### **About Pharm Robotics**

Pharm Robotics is an AgTech company on a mission to improve animal health standards and farmers' profitability! The company is currently running an equity crowdfunding campaign for this round of financing and is looking for investments in order to complete their prototype- Sureshot. Sureshot will automate both the shot delivery process and data management for farmers which is currently being done by hand and requires many resources to properly achieve compliance.

The company offers a win-win solution for farmers and cows. The system will ensure that all cows are receiving all of their required shots on time every time as well as the proven ability to lower cow stress levels through the implementation of robotics. Farmers should become more profitable by eliminating labor within this portion of this business and from increased revenue from increased pregnancy rates as well as milk yields. Pharm Robotics is uniquely positioned to take advantage of this major gap in the market and become an essential system on all dairies.
